

# LDRAvault – Managing enterprise wide verification results

LDRAvault is a web-interface that automatically aggregates reports and results from the LDRA tool suite including (but not limited to) code reviews, code coverage analysis, and unit testing results. Imported reports and results across multiple users and projects are collected into snapshots. Using the snapshots, LDRAvault generates visualizations such as heat maps and trend graphs that users can explore to discover the root causes of issues.

## Benefits

- highly scalable solution aggregates verification results and reports across users and project
- automatic aggregation supports CI/CD workflows and ensures the latest results and reports are always available
- advanced visualization provides actionable insight across both large and targeted sets of verification data

## Solution Details

- LDRAvault builds upon the proven LDRA tool suite used in hundreds of certifications
- projects can include multiple components as captured by TBbuildimport or manually specified
- results and reports are configured and aggregated on a per-user basis
- aggregated data is collected into snapshots to track progress and trends over time
- visualizations allow the viewer to easily access the underlying source(s) of data
